

99-2 Preliminary Syllabus, Da-Yeh Univ

Information			
Title	FPGA晶片設計與應用實務	Serial No. / ID	1720 / EGR5306
Dept.	電機工程學系碩士班	School System / Class	研究所碩士班1年1班
Lecturer	黃登淵	Full or Part-time	專任
Required / Credit	Optinal / 3	Graduate Class	No
Time / Place	(二)34N / H371	Language	Chinese

Introduction
<p>This course emphasizes on both theory and practice of FPGA IC design in equality, and it also provides any needed concepts of VHDL on FPGA chip design. Additionally, EDA software like Xilinx ISE and related FPGA modules will be introduced to students. Hence, after finishing the lessons, I believe the students to take this course will be capable of being skillful in IC design.</p>

Outline
<p>Introduction to VHDL Design Methodology Basics of Combinatorial Logic Design Gate Level Functional Simulation Chip Level Functional Verification Basics of Sequential Logic Design I: Registers, Counters, Timers Basics of Sequential Logic Design II: Process, System design, State Machine Logic Project Demonstration: Electronic clock, Security lock</p>

Prerequisite
<p>Digital logic design Electronics</p>
